## 1 Diagrams for cadCAD model structure through cadCAD\_diagram

Danilo Lessa Bernardineli

---

This is a mini-demo showcasing the cadCAD\_diagram plugin, which allows the user to create visualizations of the structure and flows for any cadCAD model! Just jump to the end so that you see the output of it.

In order to install the plugin, just install through pip by passing `pip install cadCAD_diagram`. The most typical use-case is to visualize a given cadCAD configuration object through:

```
from cadCAD_diagram import diagram_from_config
from cadCAD import configs

# Generate visualization for the first config
diagram_from_config(configs[0])
```

### 1.1 Dependences

```
[1]: %%capture
      !pip install cadcad

[2]: import pandas as pd
      import matplotlib.pyplot as plt
      import numpy as np
      from cadCAD.configuration import Experiment
      from cadCAD.configuration.utils import config_sim
      from cadCAD.engine import ExecutionMode, ExecutionContext, Executor
```

### 1.2 Definitions

#### 1.2.1 Initial conditions and parameters

```
[3]: initial_conditions = {
      'prey_population': 100,
      'predator_population': 15
```

```

    }

params = {
    "prey_birth_rate": [1.0],
    "predator_birth_rate": [0.01],
    "predator_death_const": [1.0],
    "prey_death_const": [0.03],
    "dt": [0.1] # Precision of the simulation. Lower is more accurate / slower
}

simulation_parameters = {
    'N': 7,
    'T': range(200),
    'M': params
}

```

### 1.2.2 Policies

```

[4]: def p_predator_births(params, step, sL, s):
    dt = params['dt']
    predator_population = s['predator_population']
    prey_population = s['prey_population']
    birth_fraction = params['predator_birth_rate'] + np.random.random() * 0.0002
    births = birth_fraction * prey_population * predator_population * dt
    return {'add_to_predator_population': births}

def p_prey_births(params, step, sL, s):
    dt = params['dt']
    population = s['prey_population']
    birth_fraction = params['prey_birth_rate'] + np.random.random() * 0.1
    births = birth_fraction * population * dt
    return {'add_to_prey_population': births}

def p_predator_deaths(params, step, sL, s):
    dt = params['dt']
    population = s['predator_population']
    death_rate = params['predator_death_const'] + np.random.random() * 0.005
    deaths = death_rate * population * dt
    return {'add_to_predator_population': -1.0 * deaths}

def p_prey_deaths(params, step, sL, s):
    dt = params['dt']
    death_rate = params['prey_death_const'] + np.random.random() * 0.1
    prey_population = s['prey_population']

```

```

predator_population = s['predator_population']
deaths = death_rate * prey_population * predator_population * dt
return {'add_to_prey_population': -1.0 * deaths}

```

### 1.2.3 State update functions

```

[5]: def s_prey_population(params, step, sL, s, _input):
    y = 'prey_population'
    x = s['prey_population'] + _input['add_to_prey_population']
    return (y, x)

def s_predator_population(params, step, sL, s, _input):
    y = 'predator_population'
    x = s['predator_population'] + _input['add_to_predator_population']
    return (y, x)

```

### 1.2.4 State update blocks

```

[6]: partial_state_update_blocks = [
    {
        'label': 'Predator dynamics',
        'ignore': False,
        'debug': True,
        'policies': {
            'predator_births': p_predator_births,
            'predator_deaths': p_predator_deaths
        },
        'variables': {
            'predator_population': s_predator_population
        }
    },
    {
        'label': 'Prey dynamics',
        'ignore': False,
        'policies': {
            'prey_births': p_prey_births,
            'prey_deaths': p_prey_deaths
        },
        'variables': {
            'prey_population': s_prey_population
        }
    }
]

```

### 1.2.5 Configuration and Execution

```
[7]: sim_config = config_sim(simulation_parameters)

exp = Experiment()
exp.append_configs(sim_configs=sim_config,
                  initial_state=initial_conditions,
                  partial_state_update_blocks=partial_state_update_blocks)

from cadCAD import configs
exec_mode = ExecutionMode()
exec_context = ExecutionContext(exec_mode.local_mode)
executor = Executor(exec_context=exec_context, configs=configs)
(records, tensor_field, _) = executor.execute()
```

```

      -----
 /----- / /----- / | /--- \
 /----- / /----- / / | / / / /
 / /----- / / / / / /----- / / / / /
 \--- / \---, / \---, / \----- / / | /----- /
by cadCAD
```

```
Execution Mode: local_proc
Configuration Count: 1
Dimensions of the first simulation: (Timesteps, Params, Runs, Vars) = (200, 5,
7, 2)
Execution Method: local_simulations
SimIDs      : [0, 0, 0, 0, 0, 0, 0]
SubsetIDs: [0, 0, 0, 0, 0, 0, 0]
Ns          : [0, 1, 2, 3, 4, 5, 6]
ExpIDs      : [0, 0, 0, 0, 0, 0, 0]
Execution Mode: parallelized
Total execution time: 0.20s
```

### 1.2.6 Results

```
[8]: import plotly.express as px
```

```
[9]: df = pd.DataFrame(records)

fig = px.line(df,
              x=df.prey_population,
              y=df.predator_population,
              color=df.run.astype(str))

fig.show()
```

### 1.3 Diagram

```
[10]: %%capture
!pip install cadCAD_diagram==0.0.1.2
```

```
[11]: from cadCAD_diagram import diagram_from_config
from cadCAD import configs
diagram_from_config(configs[0])
```

```
